

SentinelX Design Guidelines (Production-Ready UI/UX)

Design Philosophy

SentinelX should be designed as a **professional cybersecurity and blockchain intelligence platform**, not as a generic AI-generated SaaS website. The primary goal is to establish **trust, credibility, and usability** through thoughtful design rather than visual effects.

Every design decision should reinforce the feeling that SentinelX is a mature, enterprise-grade security product used by professionals.

1. Overall Visual Style

Follow

- Clean, minimal interface
- Professional enterprise software aesthetics
- Strong typography hierarchy
- Generous but purposeful whitespace
- Consistent spacing system
- Subtle interactions
- Functional layouts
- Data-first design

Avoid

- Glassmorphism
- Excessive gradients
- Neon colours
- Oversized rounded corners
- Decorative animations
- Floating 3D objects
- Emoji usage
- Generic AI illustrations
- Marketing-heavy visual effects

The interface should feel engineered rather than decorated.

2. Colour System

Adopt a restrained colour palette that reflects security and professionalism.

Primary Colours

- White (#FFFFFF)
- Soft Light Grey (#F7F8FA)
- Dark Slate (#1F2937)
- Charcoal (#111827)

Accent Colours

- Blue for primary actions
- Green for verified/safe status
- Amber for warnings
- Red for critical risks

Use colours to communicate information, not decoration.

Avoid rainbow colour palettes and unnecessary gradients.

3. Typography

Typography should carry the visual hierarchy.

Recommended fonts:

- Inter
- Geist
- IBM Plex Sans
- SF Pro
- Satoshi

Use:

- Large bold page titles
- Medium-weight section headings
- Comfortable paragraph spacing
- Clear table typography
- Consistent font sizing throughout the application

Avoid decorative or overly stylised fonts.

4. Layout Principles

Every page should have a clear visual structure.

Use:

- Logical content hierarchy
- Consistent margins

- Grid-based layouts
- Purposeful whitespace
- Alignment over decoration

Avoid making every section identical.

Different content deserves different spacing and emphasis.

5. Navigation

Navigation should prioritise usability.

Suggested navigation:

- Dashboard
- Scanner
- Threat Intelligence
- Contracts
- Reports
- Documentation
- Pricing
- Sign In

Avoid unnecessary icons.

Only use icons where they improve usability.

6. Hero Section

The homepage should immediately explain what SentinelX does.

Instead of vague marketing language such as:

"Protecting the Future"

Use clear product-focused messaging such as:

Smart Contract Security Intelligence

Detect rug pulls, ownership risks, liquidity manipulation, and malicious contract behaviour before investing.

Primary CTA:

- Analyse Contract

Secondary CTA:

- View Sample Report

The hero should include an actual screenshot of the SentinelX dashboard rather than an illustration.

7. Product Visuals

Always showcase the real product.

Use:

- Real dashboards
- Real charts
- Real tables
- Real scan results
- Real workflows
- Real reports

Avoid:

- Fake dashboards
- Abstract illustrations
- Placeholder graphics
- Decorative mock-ups

Users trust software they can actually see.

8. Dashboard Design

The dashboard should feel like a professional security console.

Focus on information density while maintaining readability.

Core widgets may include:

- Security Score
- Overall Risk Level
- Ownership Status
- Liquidity Health
- Mint Permissions
- Blacklist Check
- Contract Verification
- Recent Activity
- Threat Timeline

The emphasis should be on meaningful information rather than colourful statistic cards.

9. Scanner Experience

The scanner is the primary feature of SentinelX and should be the visual focus.

Provide:

- Large contract address input
- Paste token URL option
- Network selection
- Analyse button
- Scan progress
- Processing status

Example placeholder:

Enter Smart Contract Address

or

Paste Token URL

The workflow should be simple, fast, and intuitive.

10. Reports

Reports should resemble professional cybersecurity assessments.

Recommended sections:

- Executive Summary
- Overall Risk Score
- Threat Breakdown
- Liquidity Analysis
- Ownership Analysis
- Token Distribution
- Smart Contract Analysis
- Security Recommendations
- Export PDF

Reports should provide actionable insights rather than only charts.

11. Data Tables

Professional software relies heavily on structured data.

Tables should include columns such as:

- Contract
- Network
- Risk Level
- Liquidity
- Verification Status
- Date Analysed
- Action

Provide:

- Sorting
- Filtering
- Search
- Pagination
- Export options

Avoid oversized cards where tables communicate information more effectively.

12. Icons

Use one consistent icon library throughout the application.

Recommended:

- Lucide
- Heroicons
- Tabler Icons

Do not mix multiple icon styles.

Icons should support navigation and comprehension, not decoration.

13. Motion & Animations

Animations should improve usability rather than attract attention.

Recommended:

- Smooth fade transitions
- Subtle slide animations
- Skeleton loading states
- Hover elevation
- Button feedback
- Expand/collapse transitions

Avoid:

- Floating animations
- Particle effects
- Continuous movement
- Rotating graphics
- Flashy loading screens

Motion should feel natural and unobtrusive.

14. Loading, Empty & Error States

Every user interaction should have clear feedback.

Loading:

- "Analysing smart contract..."
- Skeleton placeholders
- Progress indicators

Empty State:

- "No scans available."
- "Start by analysing a smart contract."

Error State:

- "Unable to retrieve blockchain data."
- "Please try again in a few moments."

Success State:

- "Analysis completed successfully."

These states significantly improve perceived quality and usability.

15. Component Design

Every component should serve a purpose.

Examples include:

- Risk indicators
- Timeline views
- Activity logs
- Verification badges
- Alert panels
- Status chips

- Contract summaries
- Trend graphs

Avoid creating repetitive feature cards with little informational value.

16. Content & Copywriting

Use direct, technical, and informative language.

Avoid generic marketing phrases such as:

- AI Powered
- Revolutionising Security
- Built for the Future
- Next Generation Platform
- Unlock Innovation

Instead, communicate concrete value:

- Detect smart contract vulnerabilities
- Analyse ownership risks
- Verify liquidity conditions
- Monitor suspicious token activity
- Generate comprehensive security reports

Clear language builds trust.

17. Accessibility

Design for all users by ensuring:

- High colour contrast
- Keyboard navigation
- Visible focus states
- Accessible form labels
- Screen-reader compatibility
- Responsive layouts
- Readable typography

Accessibility should be considered from the beginning rather than added later.

18. Responsiveness

The interface should work seamlessly across:

- Desktop
- Laptop
- Tablet
- Mobile devices

Layouts should adapt naturally while preserving usability and readability.

19. Overall User Experience

Every interaction should feel deliberate.

Users should experience:

- Fast performance
- Clear navigation
- Predictable behaviour
- Reliable feedback
- Professional presentation
- Efficient workflows

The application should prioritise clarity and confidence over visual complexity.

20. Design Principles to Follow

Every screen should adhere to the following principles:

- Function over decoration
 - Simplicity over complexity
 - Clarity over visual noise
 - Consistency across all pages
 - Professional enterprise aesthetics
 - Real product demonstrations instead of illustrations
 - Data-driven layouts
 - Subtle motion
 - High usability
 - Strong accessibility
 - Trust through thoughtful design
-

Final Vision

SentinelX should feel like a modern cybersecurity platform trusted by blockchain analysts, investors, auditors, and security teams. The interface should emphasise precision, transparency, and reliability, presenting complex blockchain security information in a clean, structured, and accessible manner.

The overall experience should be comparable to high-quality enterprise software, where every element exists for a functional purpose. By focusing on real product content, disciplined visual design, consistent interactions, and a cohesive design system, SentinelX will project the professionalism and confidence expected from a production-ready security platform.
